

Stainless Steel Shelving Floating

The floating shelf uses an integrated mounting frame that easily attaches to the wall. The frame should be screwed directly into studs. Once attached, simply slide the outer shell over the frame and it locks in place with no tools. This creates amazing strength and capacity. Choose the standard "overlap seam" or upgrade to fully welded seamless for the look of a solid block of stainless steel.

****Note:** All floating shelves are 2 1/2" thick.
